

Outlook and initial statement on Renewable Energy Sources

The first problem: CO₂ concentration and temperature

Greenhouse Gas (GHG) sources

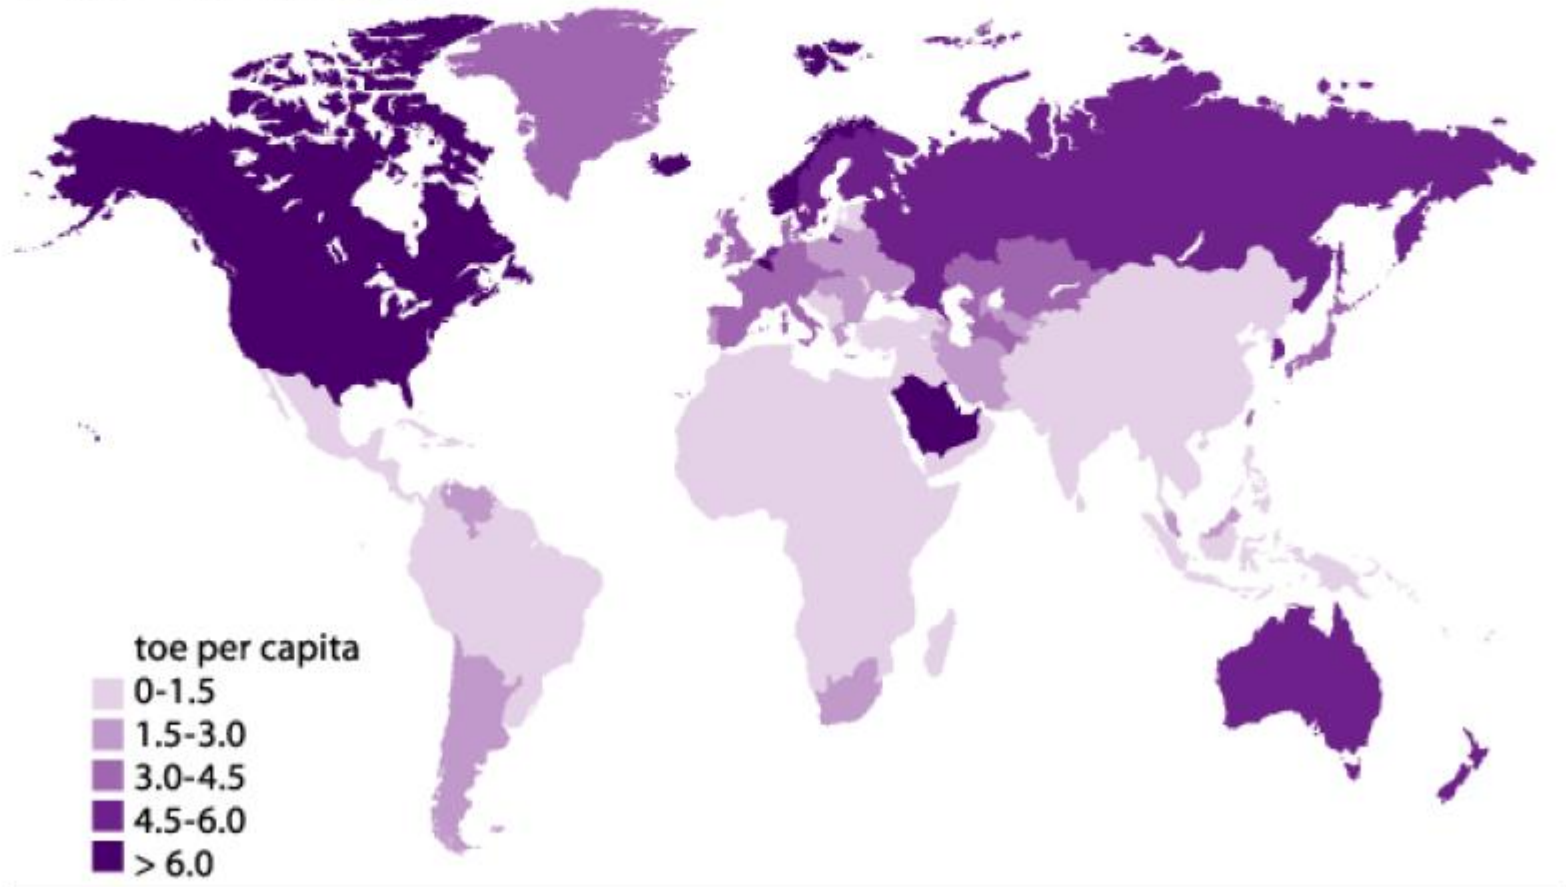

Total emissions in 2000: 42 GtCO₂e.

Energy emissions are mostly CO₂ (some non-CO₂ in industry and other energy related).

Non-energy emissions are CO₂ (land use) and non-CO₂ (agriculture and waste).

....the perfect storm*

1. Global environmental aspects
2. Local pollution problems in urban areas
3. Progressive increase of energy demand by emerging economies (BRICS)**
4. Progressive depletion and cost increase of fossil energy sources

In a single word: old energy policies are
unsustainable

* Bob Armstrong, vice President, MIT-Energy Initiative

** see Hans Rosling's speech in India

http://www.ted.com/talks/hans_rosling_asia_s_rise_how_and_when.html

A new energy policy is needed

1. Demand side management
2. Improving the efficiency of traditional energy conversion systems
3. Actions on users and incentives
4. Renewable Energy Sources

Main features of RES

- Perennial
- Non-polluting during conversion process
- Distributed
- Free energy

but..

- Diluted
- Discontinuous
- Often unpredictable
- Costly installations

RES types

- **Solar Thermal**
- **Biomass**
- **Geothermal**
- **Solar PV**
- **Wind**
- *Tidal*
- *Waves*
- *Hydraulics*

Thermal

Electric

Photography for Environment 2012

RES – Heat Production efficiencies - Overview

| Source | Thermal Use | η % |
|-------------------|---------------------------------|----------------------------|
| Sun | Solar Collectors | 40-60 |
| Geothermal | Direct Indirect (through HP) | 80-90 COP=4 |
| Biomass, biogas | Boilers | 85 |
| Solid Urban Waste | Boilers | 80 |

RES - Electricity Production efficiencies - Overview

| Source | Electrical converter | η % |
|--------------------|-----------------------------|----------------------------|
| Sun | Photovoltaic (PV) Cells | 8-18 |
| Wind | Wind Turbines | 30-50 |
| Geothermal | Geothermal power stations | 30-35 |
| Hydraulic | Hydraulic Turbines | 80-90 |
| Biomass, biogas | Thermal Power Stations | 30-40 |
| Urban waste | Thermal Power Stations | 30-40 |

1. Renewable sources originating from the Sun:

- **Solar radiation (direct and diffused)**
- **Hydraulic Energy**
- **Wind**
- **Biomass**
- **Sea currents, waves**

2. Other renewable sources

- **Geothermal energy (Earth endogenous heat)**
- **Tides (Earth-Moon gravitational energy)**

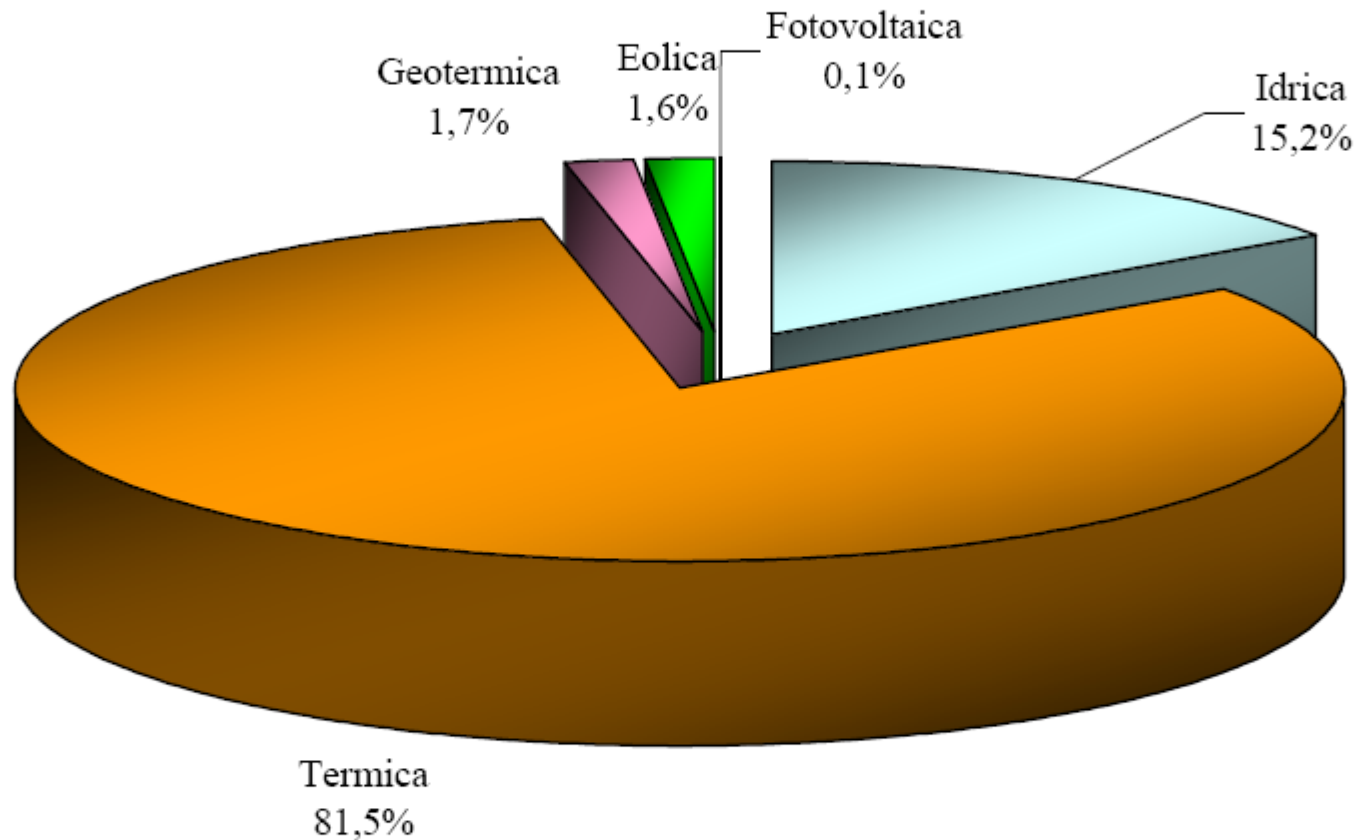

3. "Practically unlimited" sources

- **self-breeding nuclear fission**
- **nuclear fusion**

4. Non-Renewable sources

- **fossil fuels: coal, oil, natural gas**
- **thermal nuclear fission**
